

Multi-level explanations in neuroscience I: From genes to subjective experiences.

Włodzisław Duch

Neurocognitive Laboratory,
Center of Modern Interdisciplinary Technologies,
Dept. of Informatics, Faculty of Physics, Astronomy & Informatics,
Nicolaus Copernicus University

Google: W. Duch

BRANDY, 26-27 June, Val del Sol

On the threshold of a dream ... (50 y!)

How subjective mental states arise from specific activity of the brain networks?

- Mind/Brain at many levels.
- Global brain initiatives.
- Human enhancement or why is this important
- Brain networks.
- Decoding Mental States.
- Neurodynamics.
- Final words.

Ultimate goal: Optimize/repair your brain!

Duch W. (2012) Mind-Brain Relations, Geometric Perspective and Neurophenomenology, American Phil. Assoc. Newsletter 12(1), 1-7.

Duch, W. (2019) Mind as a shadow of neurodynamics. [Physics of Life Reviews](#)

Mind/brain at many levels

Brains \Leftrightarrow Minds

Define mapping $S(M) \Leftrightarrow S(B)$, as in BCI.

How do we describe the state of mind?

Verbal description is not sufficient unless words are represented in a space with dimensions that measure different aspects of experience.

Stream of mental states, movement of thoughts

\Leftrightarrow trajectories in psychological spaces.

Two problems: discretization of continuous processes for symbolic models, and lack of good phenomenology – we are not able to describe our mental states.

Neurodynamics: bioelectrical activity of the brain, neural activity measured using EEG, MEG, NIRS-OT, PET, fMRI ...

E. Schwitzgabel, Perplexities of Consciousness. MIT Press 2011.

Neuropsychiatric phenomics

2008: The Consortium for Neuropsychiatric Phenomics

“... categories, based upon presenting signs and symptoms, may not capture fundamental underlying mechanisms of dysfunction” (Insel et al., 2010).

New approach: RDOC NIMH.

Description of organisms at different levels will help to answer different types of questions.

Network level is in the middle and can be connected to the mental level via computational models.

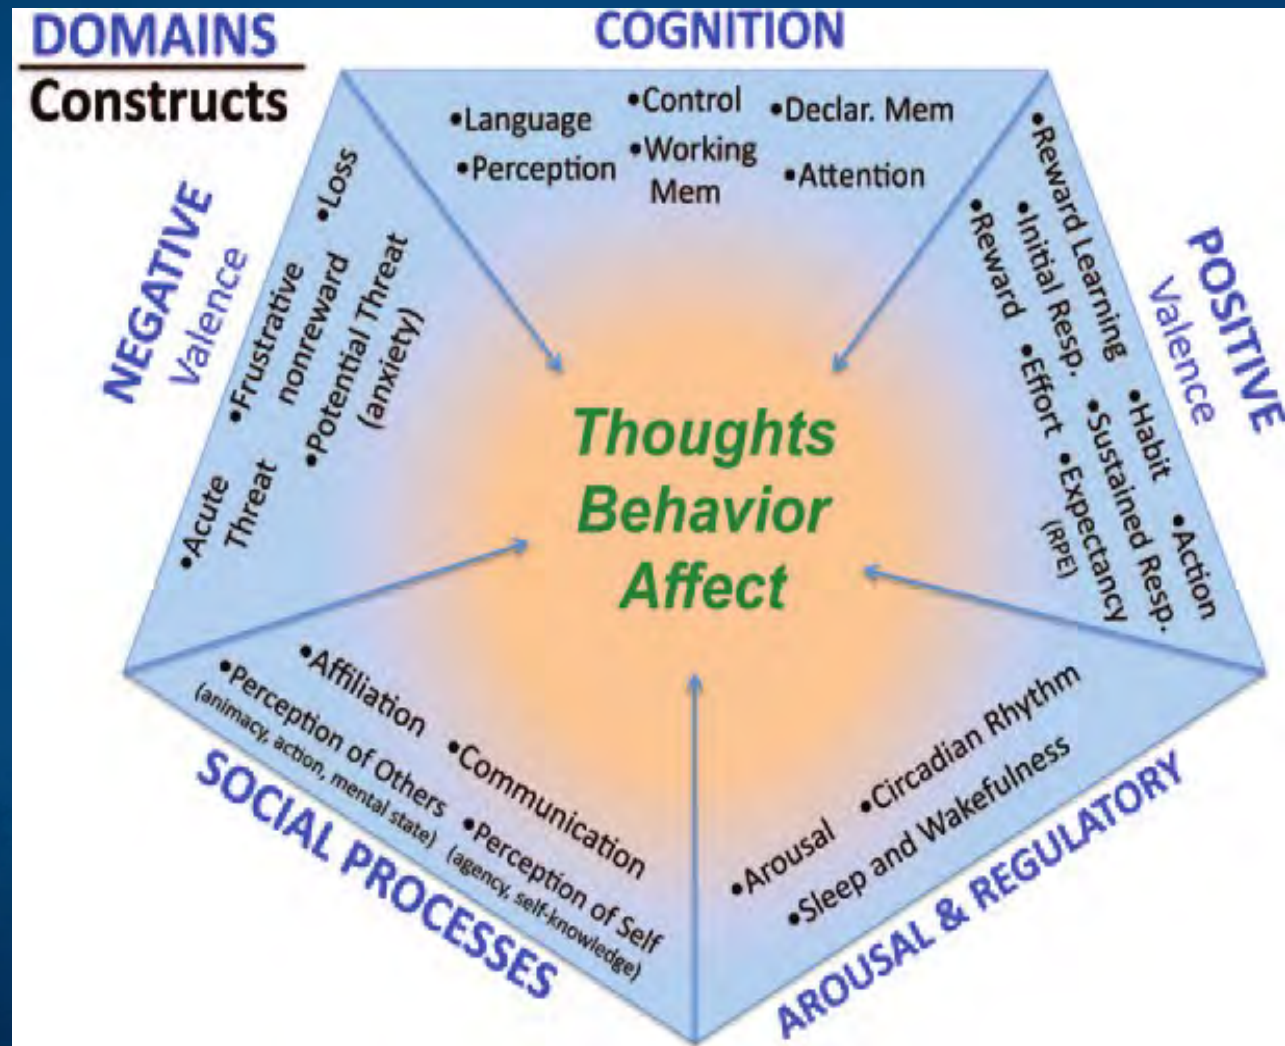

NIMH RDoC Matrix for deregulation of 5 large brain systems.

Psychological constructs are necessary to talk about mental states.

How are they related to physical processes?

Lewin's psychological forces

Fig. 5. "Positive central force field corresponding to a positive valence ($V_a > 0$)" (

Field Theory in
Social Science
Selected
Theoretical Papers

Kurt Lewin, founder of social psychology, analyzed interactions between people and their environment creating psychology inspired by field theory. Transitions between mental states = psychological forces.

Regions of positive valence are in basins of attractors of neurodynamics.

K. Lewin books: *Principles of Topological Psychology* (1936);
Conceptual Representation & Measurement of Psychological Forces (1938);
Field Theory in Social Science (1951).

NIMH RDoC Matrix for deregulation of 6 large brain systems.

Instead of classification of mental disease by symptoms use **Research Domain Criteria (RDoC)** based on multi-level neuropsychiatric phenomics.

1. **Negative Valence Systems**, primarily responsible for responses to aversive situations or context, such as fear, anxiety, and loss.
2. **Positive Valence Systems** are primarily responsible for responses to positive motivational situations or contexts, such as reward seeking, consummatory behavior, and reward/habit learning.
3. **Cognitive Systems** are responsible for various cognitive processes.
4. **Social Processes Systems** mediate responses in interpersonal settings of various types, including perception and interpretation of others' actions.
5. **Arousal/Regulatory Systems** - generating activation of neural systems in various contexts, homeostatic regulation, energy balance and sleep.
6. **Sensorimotor systems** responsible for the control and execution of motor behaviors, and their refinement during learning and development.

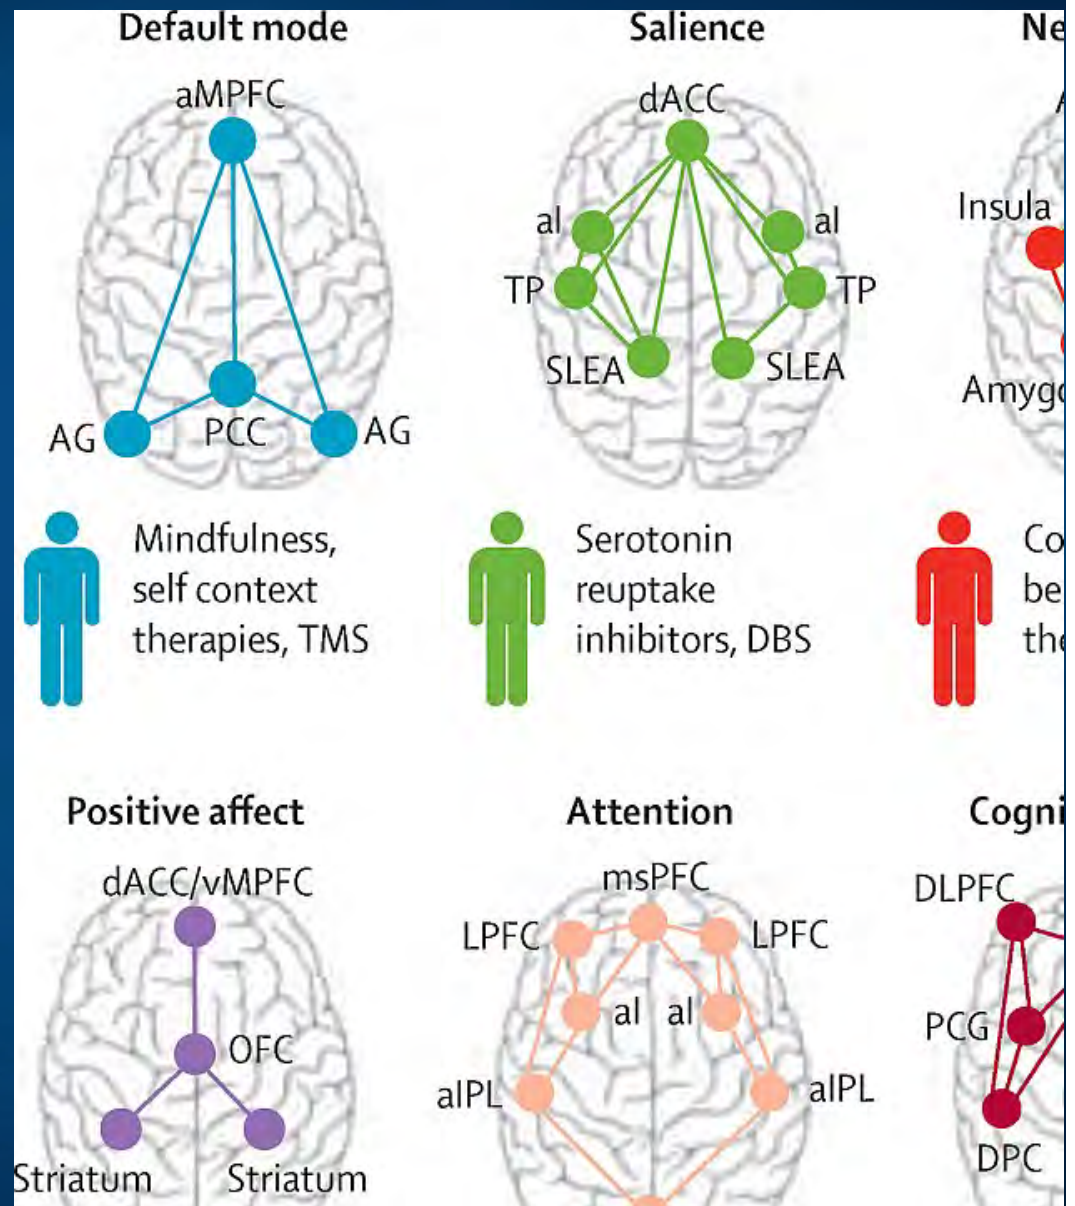

Multi-level phenomics

Research Domain Criteria (RDoC) matrix is based on **multi-level neuropsychiatric phenomics** describing large brain systems deregulation, but links to behavior should be analyzed at the network level, where specialized functions are implemented. **In AI:**

M. Minsky, Society of mind (1986)

Decompose brain network dynamics into meaningful components of activity related to various brain functions.

Include influence of genes, molecules, cells, **circuits**, physiology, behavior, self-reports on network functions.

RDoC Matrix for „cognitive domain”

Global Brain Initiatives
or why is this so important?

Costs of brain diseases

European Brain Council (EBC) reports (2010; 2014).

Consensus Statement on European Brain Research (2015) includes a chapter on Computational Neuroscience, data repositories and analytics.

179 million, or 1/3 of all European citizens, had at least one brain disorder.

45% of the total annual health budget of Europe!

Total cost of brain disorders in EU estimated in 2010: **798 billion €/year**, average **direct** health care costs represent 37%, direct nonmedical costs 23%, and indirect costs 40%.

China: >20% of population (~250 mln) suffering from some mental disorder.

Total costs of disorders of the brain in Poland, 2010 estimates.

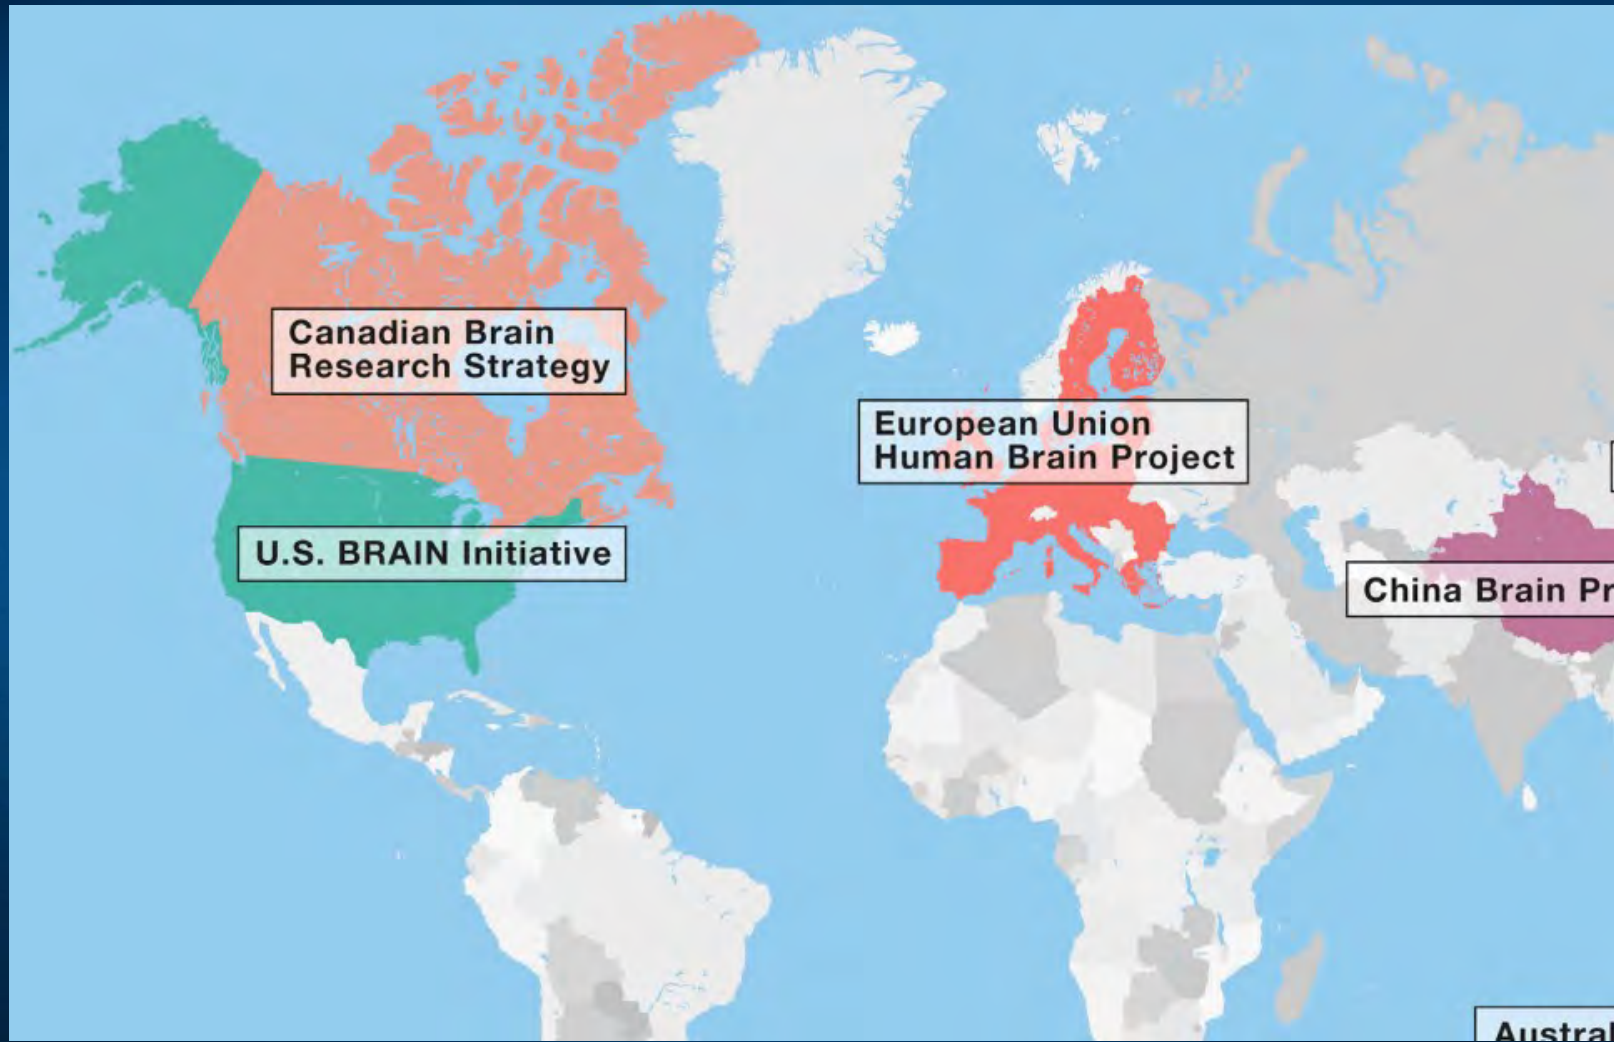

Addiction	Anxiety	Dementia	Epilepsy	Headache	Mood	Psychotic	Stroke	x1000
1 201	5 261	358	298	12 025	2 499	371	503	# people
2 501	2 882	2 480	745	1 559	4 489	3 723	2 187	mln €

Gustavsson et al. (2011). Cost of disorders of the brain in Europe 2010.

European Neuropsychopharmacology, 21(10), 718–779.

International Brain Initiatives

BRAIN
INITIATIVE

Advance Neurotechnologies

Accelerate the development and
application of new neurotechnologies.

Support multi-disciplinary teams and
stimulate research to rapidly enhance current
neuroscience technologies and catalyze
innovative scientific breakthroughs.

Human Brain Project, EU Flagship, and Obama BRAIN Initiative (2013):
Brain Research through Advancing Innovative Neurotechnologies.

“Develop new technologies to explore how the brain’s cells and circuits interact at the speed of thought, ultimately uncovering the complex links between brain function and behavior. Explore how the brain records, processes, uses, stores, and retrieves vast quantities of information. Help bring safe and effective products to patients and consumers.”

Since 2013 numerous exciting developments in neurotechnology and our understanding of the brain have been made by scientists across the globe.

The mission of IEEE Brain is to facilitate cross-disciplinary collaboration and coordination to advance research, standardization and development of technologies in neuroscience to help improve the human condition.

20 IEEE Societies are involved, including:

IEEE Computational Intelligence Society; Computer Society; Consumer Electronics Society; Digital Senses Initiative; Robotics and Automation Society; Sensors Council; Signal Processing Society; Society on Social Implications of Technology; **Systems, Man, and Cybernetics Society**, International Neuroethics Society, and a few other societies.

Most these societies are also involved in artificial intelligence.

Satya Nadella (CEO, Microsoft): to celebrate National Disability Employment Awareness Month, I'm sharing examples of how technology can be applied to empower the more than one billion people with disabilities around the world.

Workshop on Brain-Machine Interface Systems Global Current and Emerging Brain Initiatives Brain Hackathon

IEEE
SMC

Part of the Brain-Machines Interface Workshop and SMC2018.

The IEEE SMC Society and the IEEE President, James Jefferies, are proud to invite you on to a special meeting of **Global Current and Emerging Brain Initiative leaders** and representatives from other groups working on large-scale multi-year brain projects from Australia, Canada, China, Europe (HBP), Japan, Korea, New Zealand, **Poland**, Russia, and US (NSF and NIH), with representatives from the **IEEE Brain Initiative**, International Neuroethics Society, industry, and other stakeholders.

IEEE welcomes collaborative discussions with all stakeholders to better align and integrate IEEE with other existing brain efforts.

Neuroscience => AI

Hassabis, D., Kumaran, D., Summerfield, C., Botvinick, M. (2017). Neuroscience-Inspired Artificial Intelligence. *Neuron*, 95(2), 245–258.

Affiliations: Google DeepMind, Gatsby Computational Neuroscience, Institute of Cognitive Neuroscience, Uni. College London, Uni. of Oxford.

Artificial neural networks – simple inspirations, but led to many applications.

Amoset al. (2018). **Learning Awareness Models**. *ArXiv:1804.06318*.

AI Systems inspired by Neural Models of Behavior:

(A) **Visual attention**, foveal locations for multiresolution “retinal” representation, prediction of next location to attend to.

(B) **Complementary learning systems** and episodic control: fast learning hippocampal system and parametric slow-learning neocortical system.

(C) Models of **working memory** and the Neural Turing Machine.

(D) Neurobiological models of **synaptic consolidation** and the elastic weight consolidation (EWC) algorithm.

BICA, Brain-Inspired Cognitive Architecture

Understanding the brain from engineering perspective means to build a model of the brain showing similar functions.

Cognitive informatics,
Neurocognitive Informatics.

BICA = Brain Inspired
Cognitive Architecture.

Review: Duch, Oentaryo,
Pasquier, Cognitive
architectures: where do we
go from here? 2008

ORNL

- ORNL, since 1943 as part of the Manhattan Project, largest US Department of Energy laboratory. Budget \$1.4 billion, Summit ~1.9 Eflop!
10.07.2019: High-Performance Computing and Artificial Intelligence for Mental Illness, Suicide Prevention, and Substance Abuse Research Summit.

Neuromorphic wall

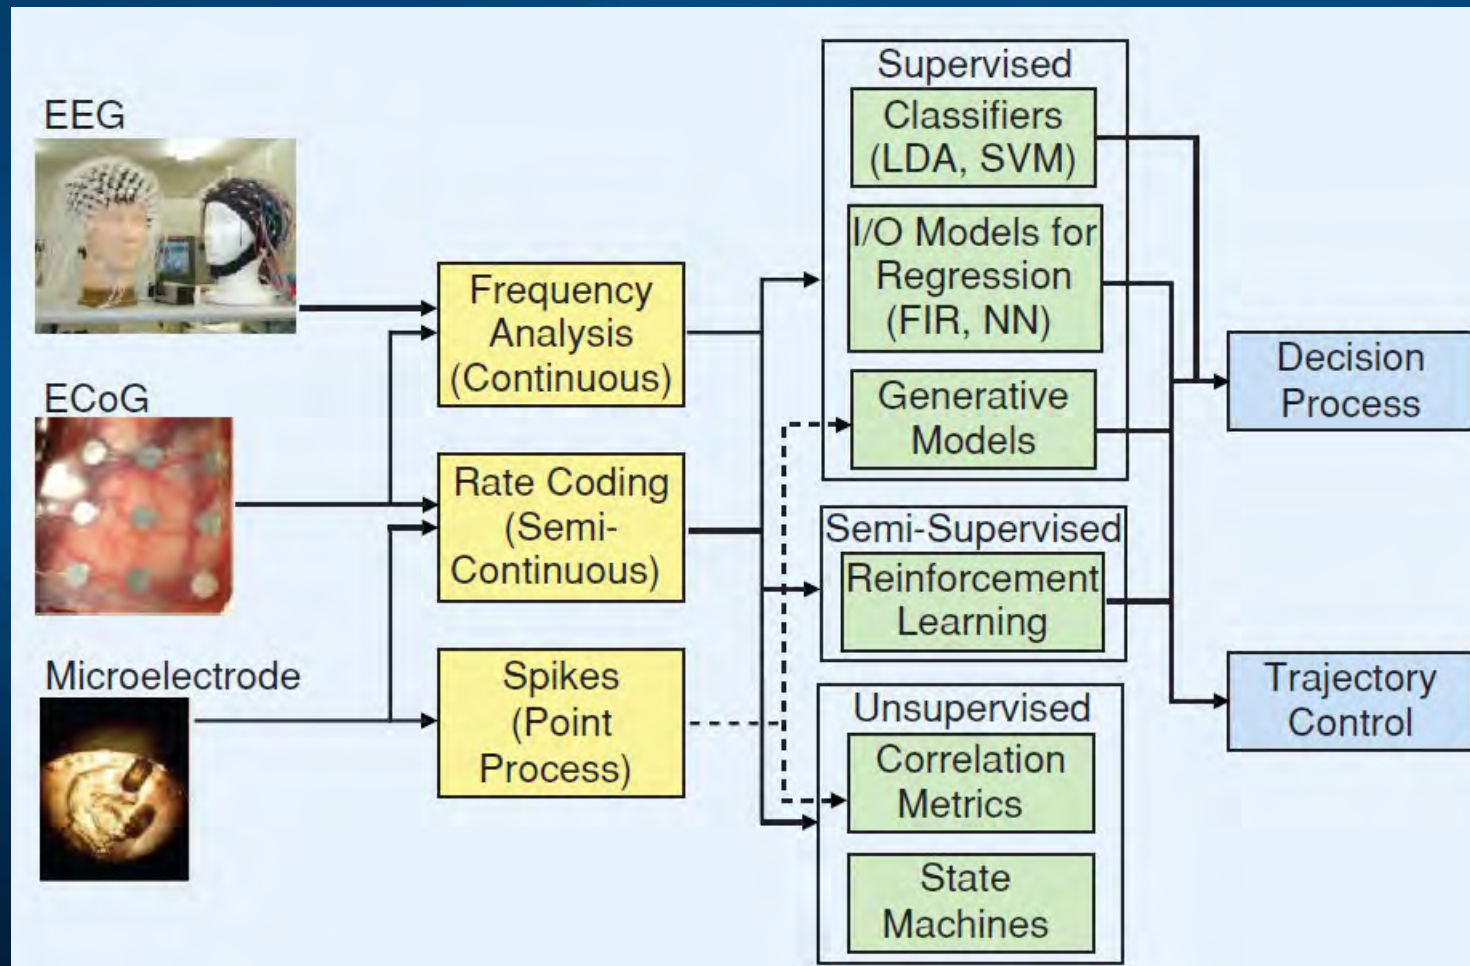

1024 TN chips, or 1 B neurons and 256 B synapses.
Complexity of horse brain, 1/4 gorilla, 1/6 chimpanse.

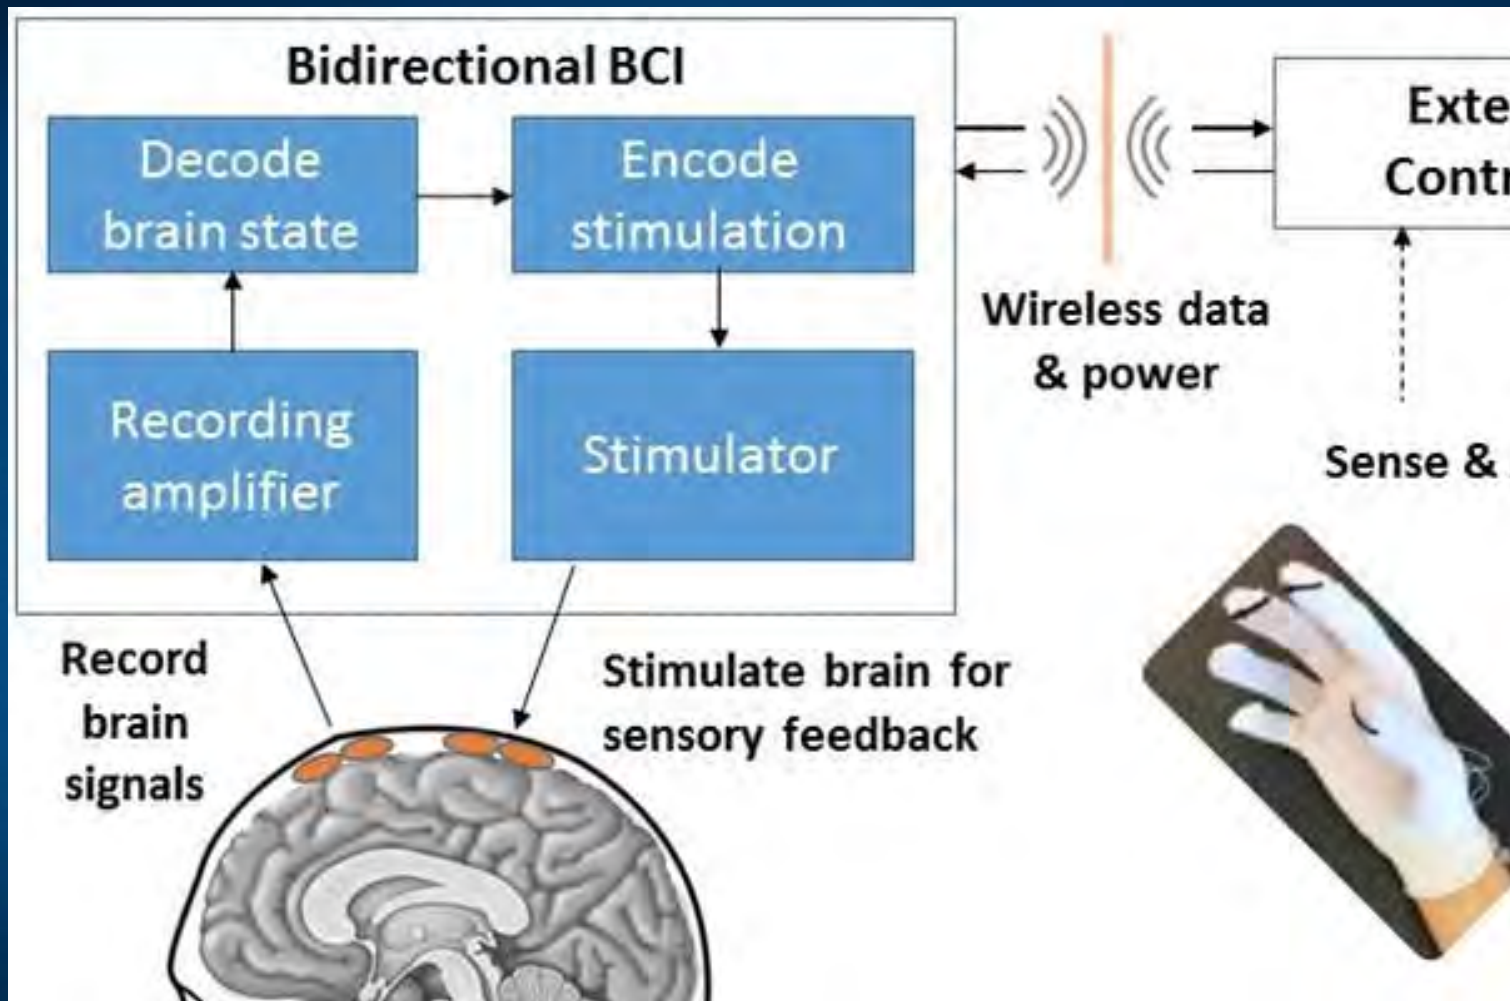

Human Enhancement Perspectives

BCI: wire your brain ...

Non-invasive, partially invasive and invasive signals carry progressively more information, but are also harder to implement. EEG is still the king!

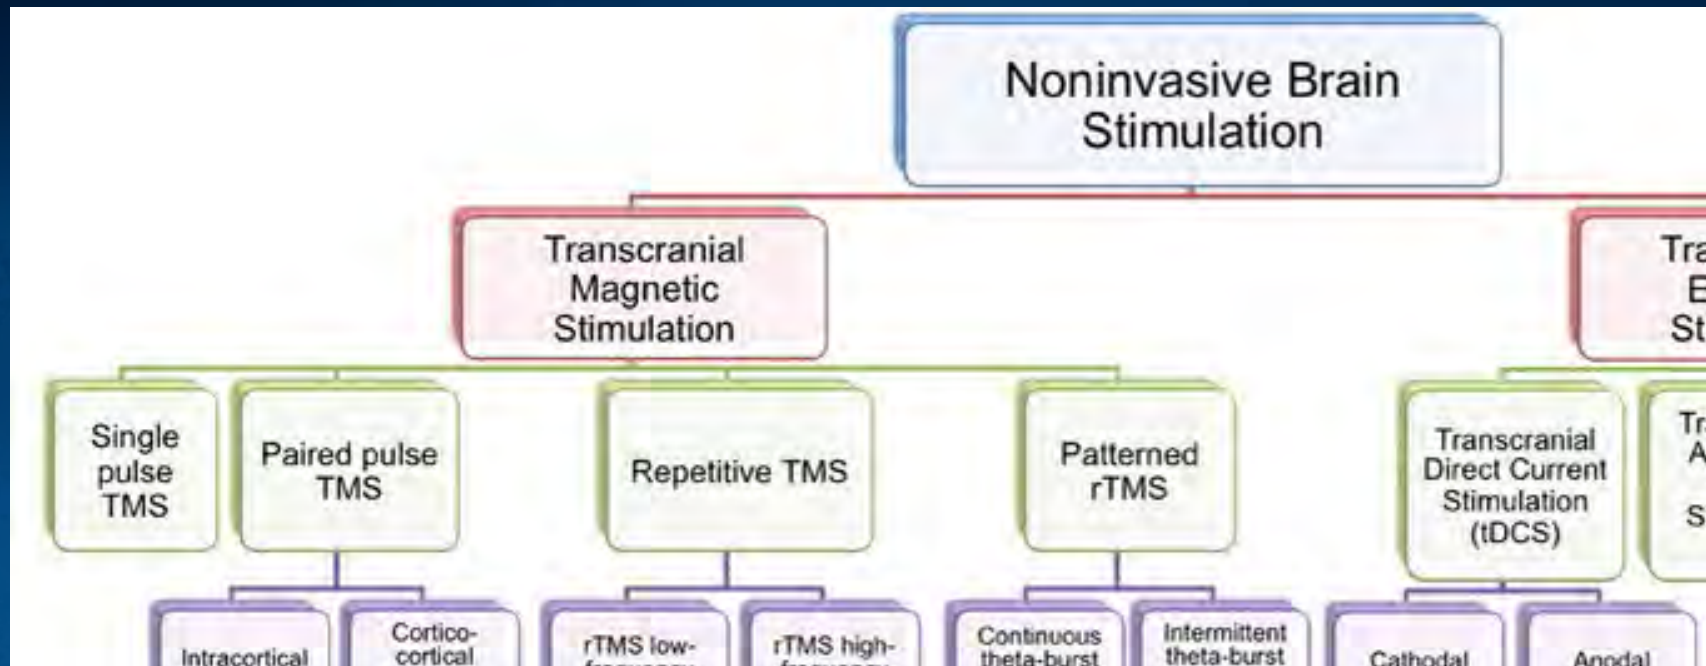

Brain-Computer-Brain Interfaces

Closed loop system with brain reading and stimulation for self-regulation. Sensory signals may come from Virtual Reality.

Brain stimulation

ECT – Electroconvulsive Therapy

VNS – Vagus Nerve Stimulation

Ultrasound, laser ... stimulation.

Complex techniques, but portable phones are also complex.

Attention? Just activate your cortex, no effort is needed!

TMS

tDCS

HD EEG/DCS?

EEG electrodes + DCS.

Reading brain states

=> transforming to common space

=> duplicating in other brains

Applications:

depression, neuro-plasticity,
pain, psychosomatic
disorders, teaching!

Multielectrode DCS
stimulation with 256
electrodes induces
changes in the brain
increasing neuroplasticity.

BCBI for learning

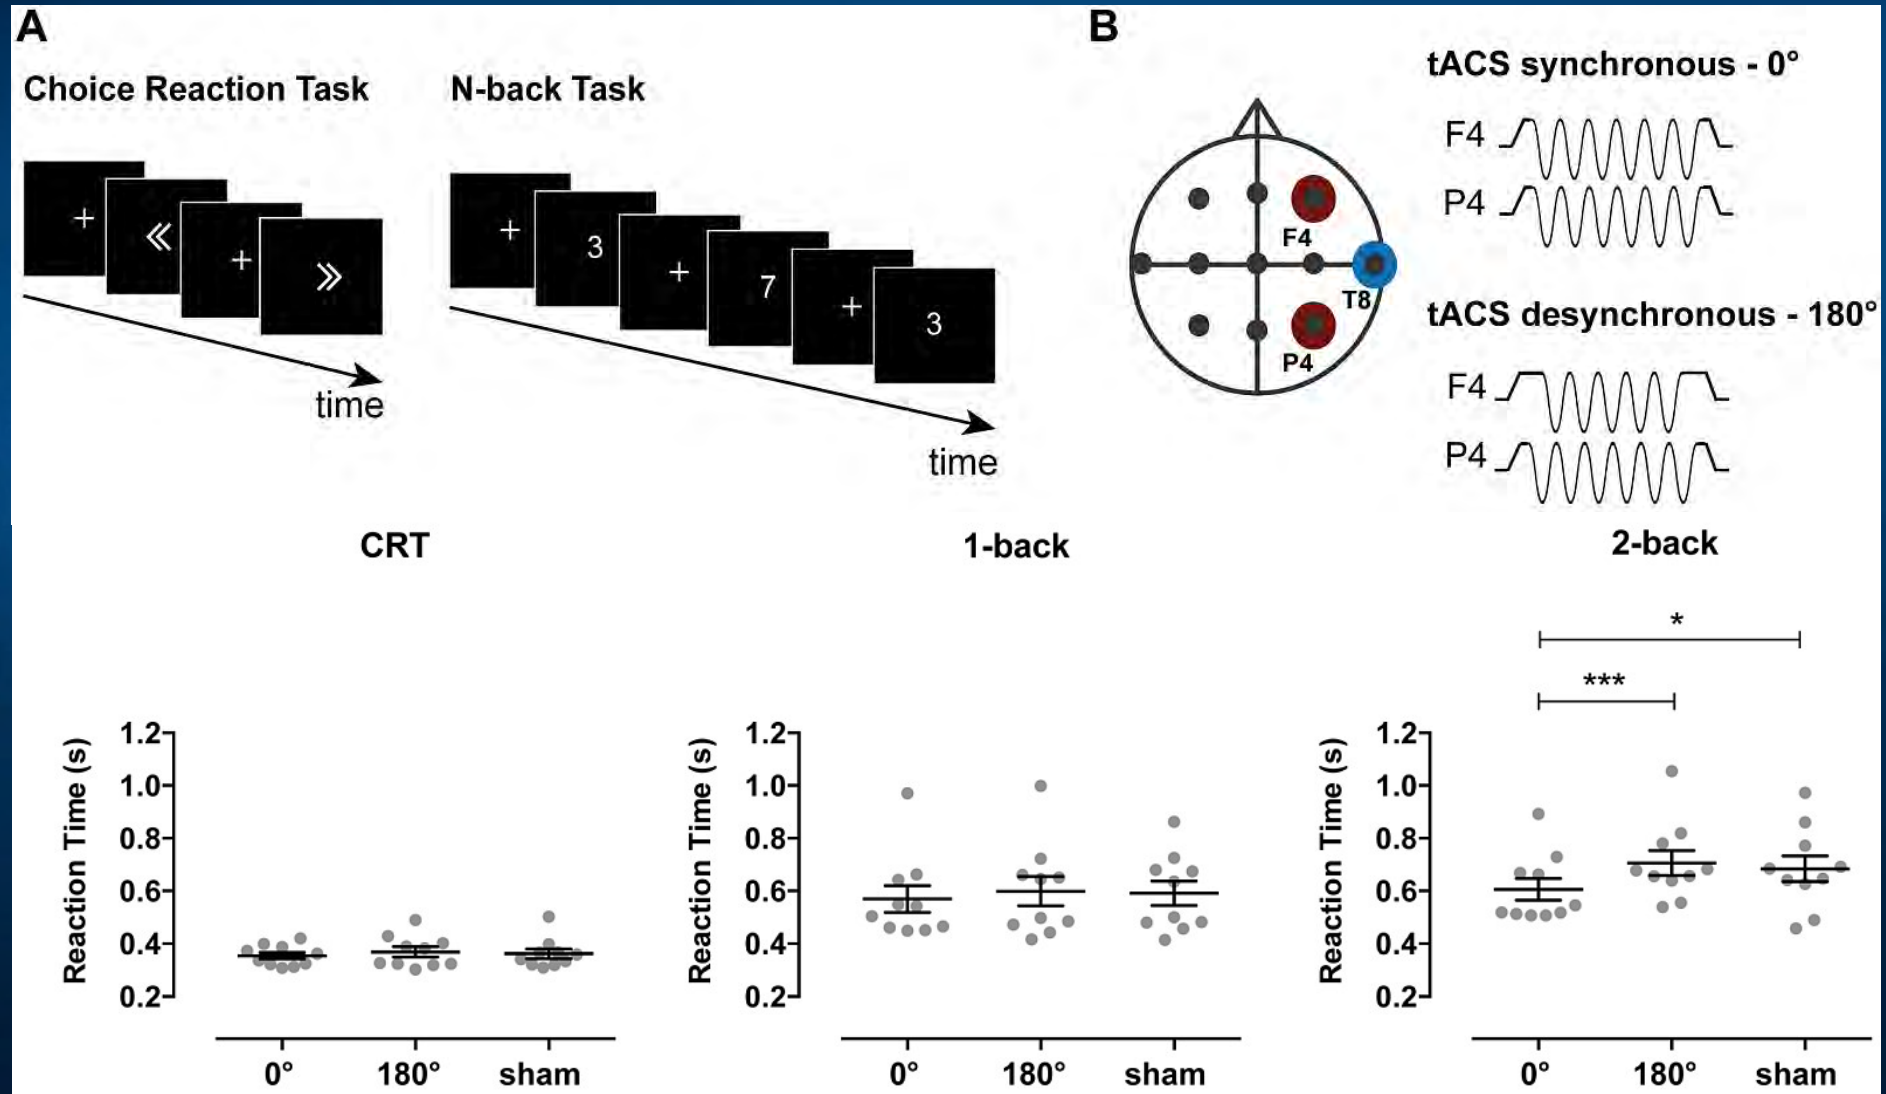

Your brain knows better what is interesting than you do!
Information relevance (salience) from brain signals!

1. Eugster, M. J. A., ... N., Jacucci, G., & Kaski, S. (2016). Natural brain-information interfaces: Recommending information by relevance inferred from human brain signals. *Scientific Reports* 6, 38580.
2. Violante et al. (2017) Externally induced frontoparietal synchronization modulates network dynamics and **enhances working memory** performance. *Elife* 6, e22001
3. Mazurek & Schieber (2017). Injecting Instructions into Premotor Cortex. *Neuron*, 96(6), 1282–1289.e4. **Teaching skills by stimulating cortex:** microstimulation too low to evoke muscle activation, applied in premotor cortex of monkeys, instructed specific actions.

Neuroimaging based assessment strategy may provide an objective means of evaluating learning outcomes in the application of UDL, an educational framework for flexible learning environments that adapt to individuals.

Synchronize PFC/PC

Violante, I.R. et al. Externally induced frontoparietal synchronization modulates network dynamics and enhances working memory performance. *ELife*, 6 (2017).

Million nanowires in your brain?

DARPA (2016): Neural Engineering System Design (NESD)

Interface that reads impulses of 10^6 neurons, injecting currents to 10^5 neurons, and reading/activating 10^3 neurons.

DARPA Electrical Prescriptions (ElectRx) project enables “artificial modulation of peripheral nerves to restore healthy patterns of signaling in these neural circuits. ElectRx devices and therapeutic systems under development are entering into clinical studies.”

Neural lace i neural dust project for cortex stimulation.

Targeted Neuroplasticity Training

DARPA (2017): Enhance learning of a wide range of cognitive skills, with a goal of reducing the cost and duration of the Defense Department's extensive training regimen, while improving outcomes. TNT could accelerate learning and reduce the time needed to train foreign language specialists, intelligence analysts, cryptographers, and others.

Memory implants

Ted Berger (USC, [Kernel](#)): hippocampal neural prosthetics facilitate human memory encoding and recall using the patient's own hippocampal spatiotemporal neural codes. Tests on rats, monkeys and on people gave memory improvements on about 35% ([J. Neural Engineering 15, 2018](#)).

DARPA: Restoring Active Memory (RAM), new closed-loop, non-invasive systems that leverage the role of neural “replay” in the formation and recall of memory to help individuals better remember specific episodic events and learned skills.

Brain networks

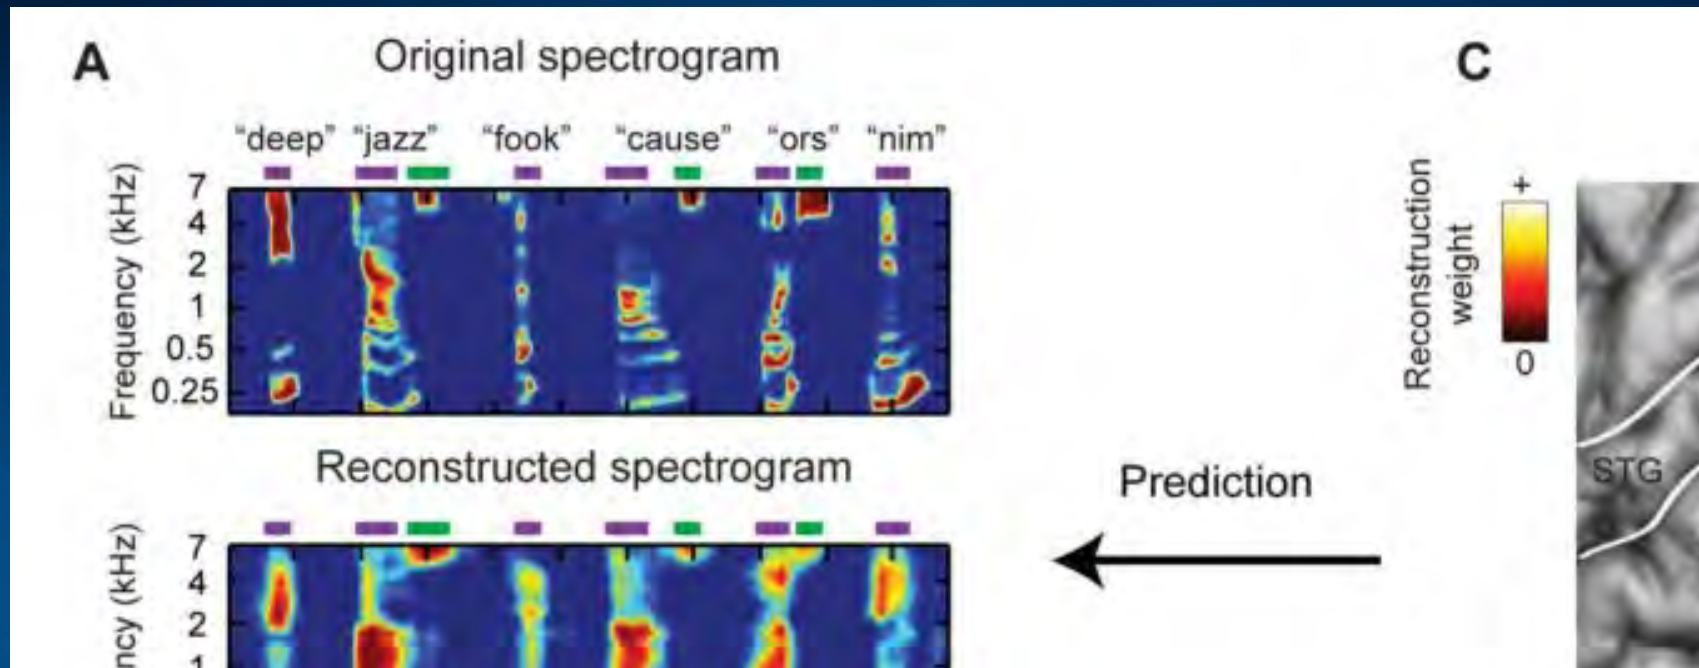

Mental state: strong coherent activation

Many processes go on in parallel, controlling homeostasis and behavior. Most are automatic, hidden from our Self. What goes on in my head?

Various subnetworks compete for access to the highest level of control - consciousness, the winner-takes-most mechanism leaves only the strongest. Signal Detection Theory: extract quasistable states/intentions from noise.

Though: time, position, energy, frequency

Spectrogram of words – distribution of energy in space/time/frequency
– may be reconstructed from local field potentials measured using electrocorticography, and then used to activate voice synthesizer, changing brain activations to speech.

Listening to thoughts

Patterns of cortical activations in higher order human auditory cortex allows for neural decoding of speech acoustic parameters, decoder is used to synthesize speech when a participant **silently mimed sentences**.

Pasley et al. (2012); G.K. Anumanchipalli, J. Chartier, E.F. Chang, Speech synthesis from neural decoding of spoken sentences. [Nature 24/4/2019](#)

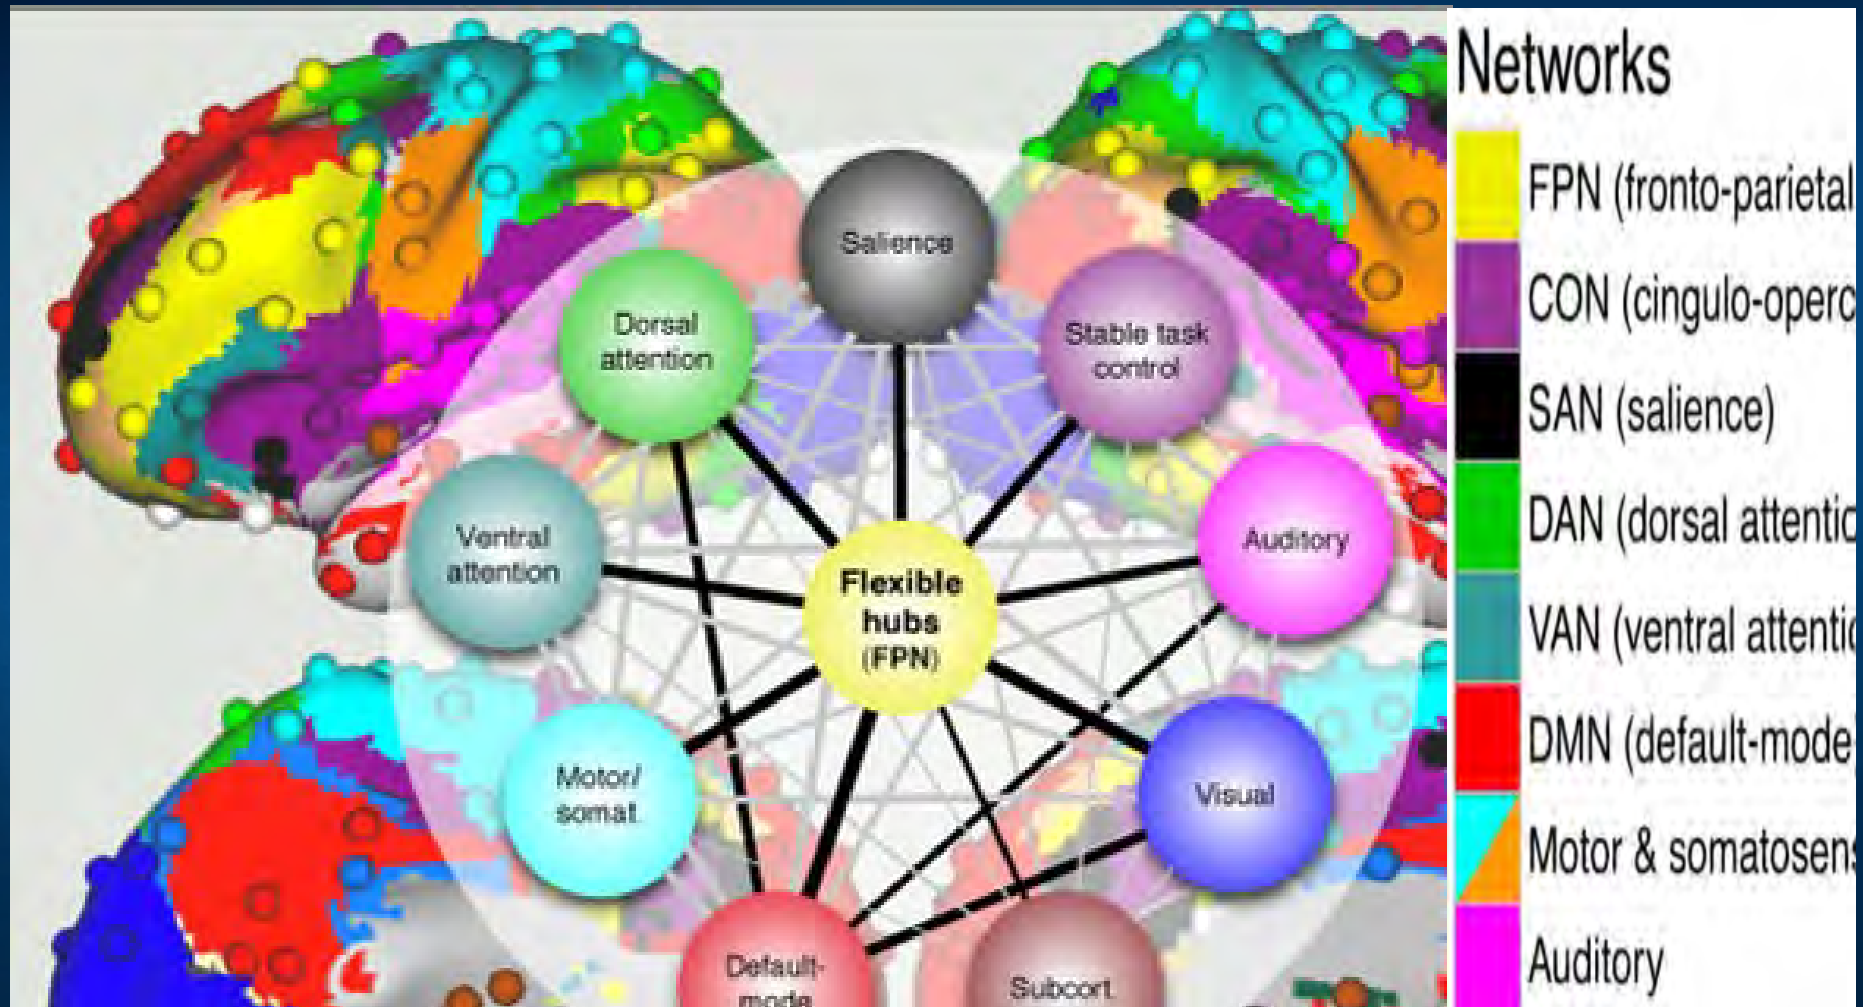

GNWT

Global Neuronal Workspace Theory (Dehaene et al. 1998)

Brain is a substrate in which thoughts, feelings and intentions arise.

Neurocognitive Basis of Cognitive Control

Central role of fronto-parietal (FPN) flexible hubs in cognitive control and adaptive implementation of task demands (black lines=correlations significantly above network average). Cole et al. (2013).

Decoding mental states

Neuroimaging words

Predicting Human Brain Activity Associated with Words, "of Nouns," T. M. Mitchell et al, Science

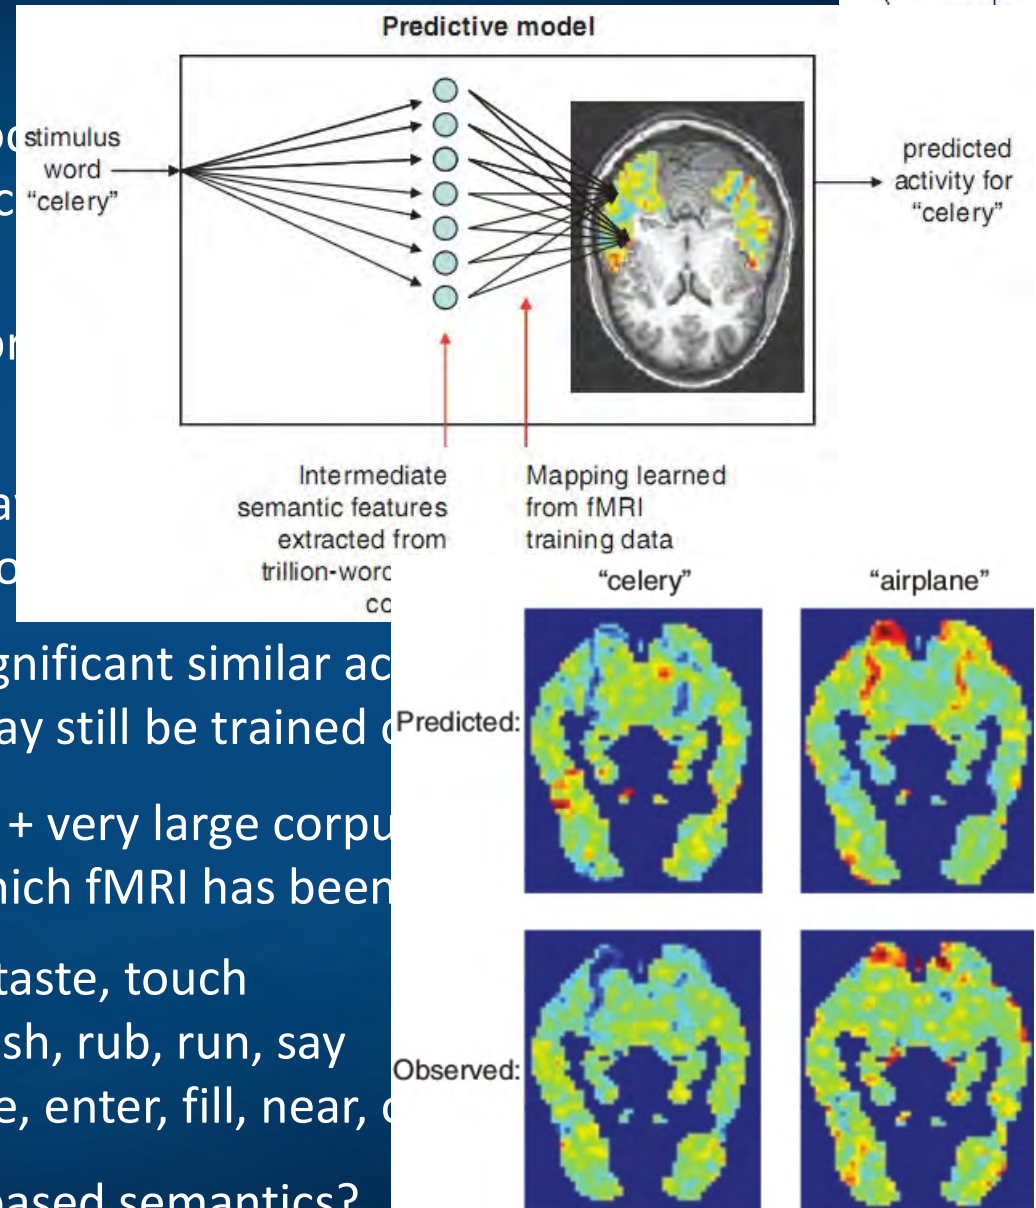

- Clear differences between fMRI brain activity patterns for different nouns.
- Reading words and seeing the drawings of objects in the brain presumably reflecting semantics of the words.
- Although individual variance is significant similar activity patterns across different people, a classifier may still be trained on individual data.
- Model trained on ~10 fMRI scans + very large corpus of word co-occurrence activity for over 100 nouns for which fMRI has been recorded.

Sensory: fear, hear, listen, see, smell, taste, touch

Motor: eat, lift, manipulate, move, push, rub, run, say

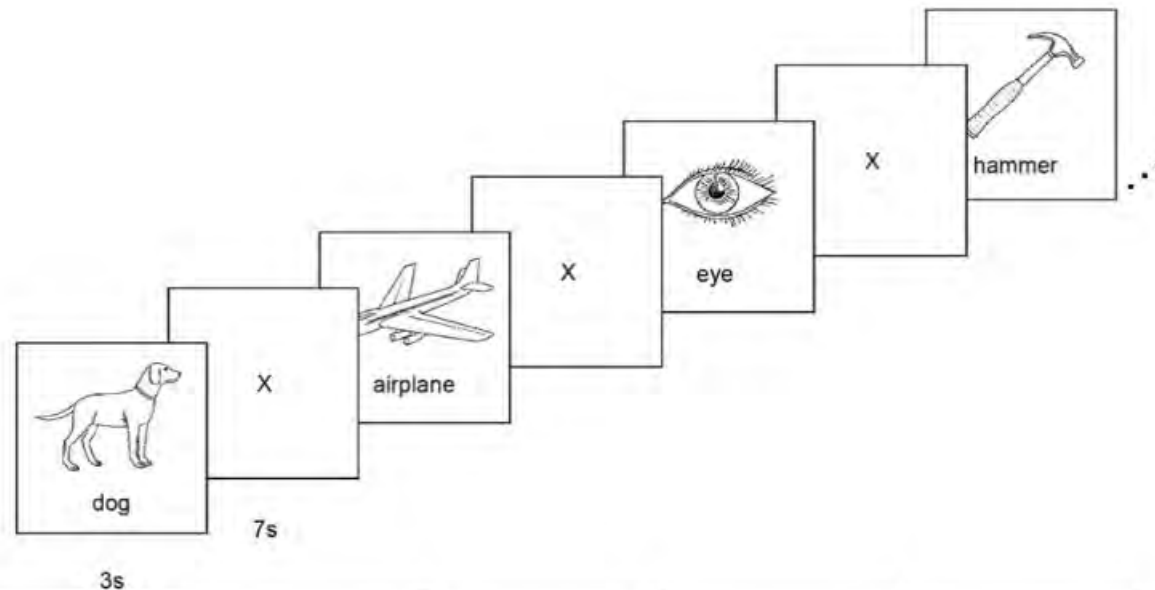

Abstract: approach, break, clean, drive, enter, fill, near, open

Are these 25 features defining brain-based semantics?

Quasi-stable brain activations?

Maintain brain activation for longer time. Use pictures, video, sounds ...

Category	Exemplar 1	Exemplar 2	Exemplar 3	Exemplar 4	Exemplar 5
animals	bear	cat	cow	dog	horse
body parts	arm	eye	foot	hand	leg
buildings	apartment	barn	church	house	igloo

Can we induce stable cortical activation? Locate sources in similar areas as BOLD? Interpret brain activations in terms of brain-based semantics?

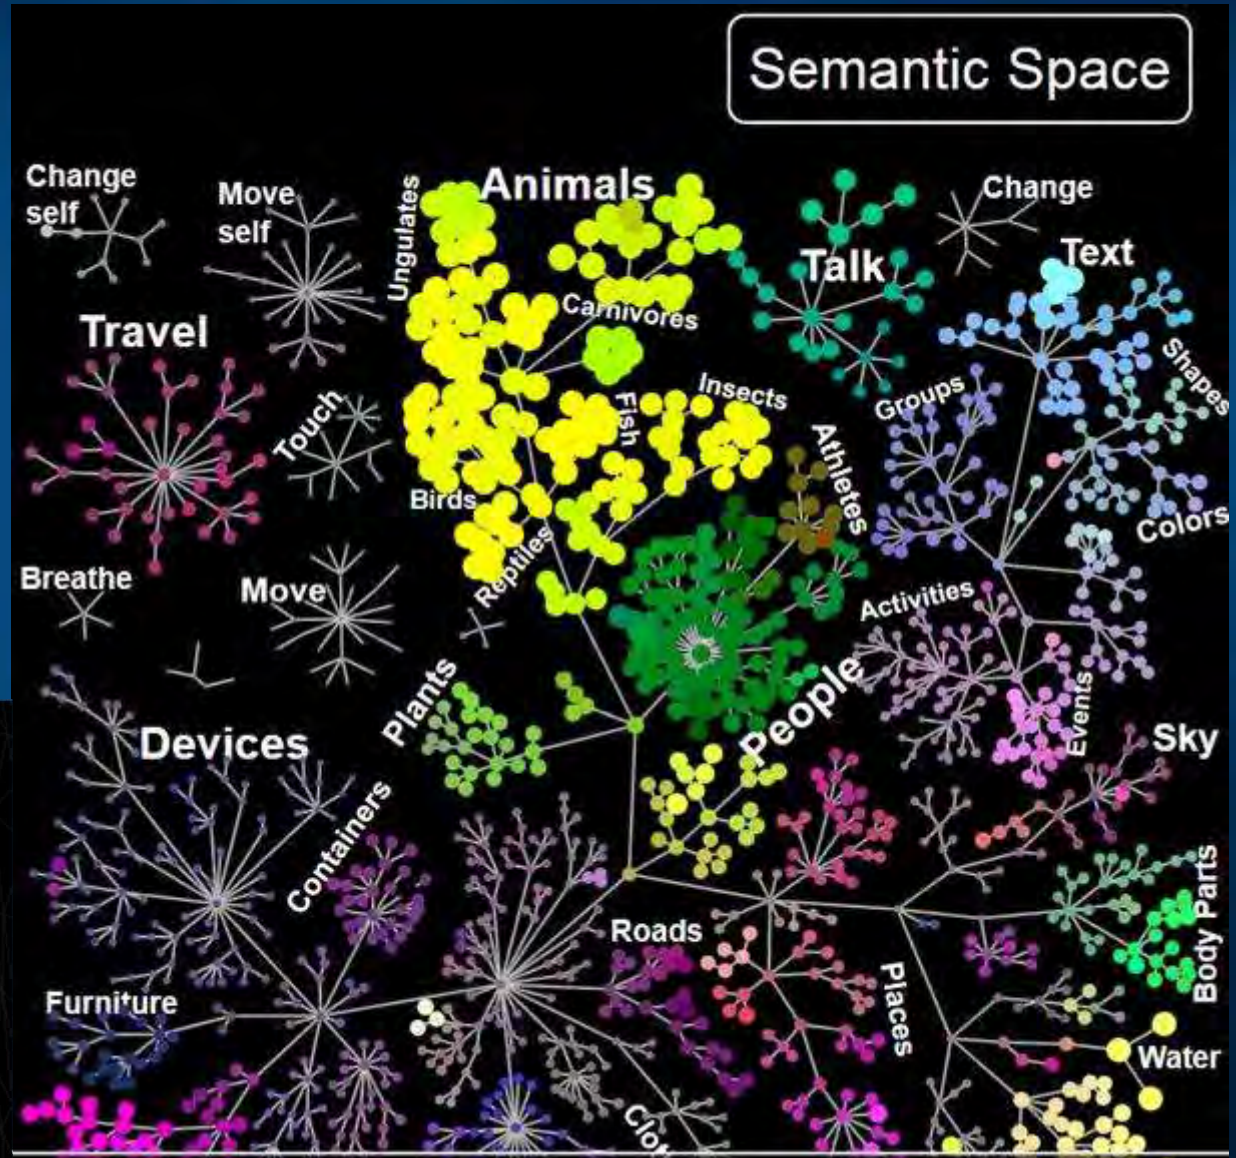

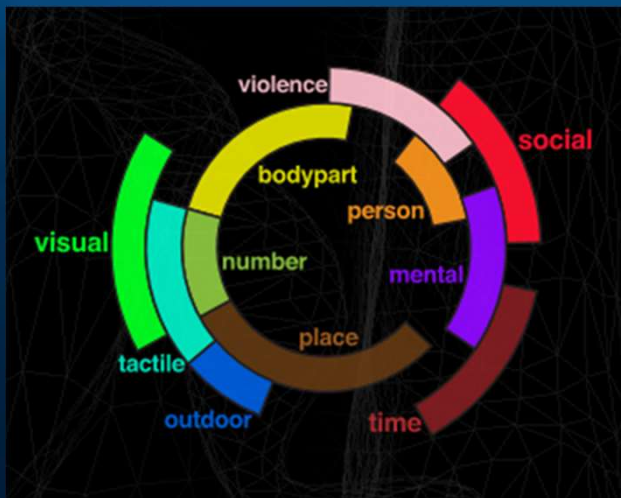

Semantic neuronal space

Words in the semantic space are grouped by their similarity.

Words activate specific ROIs, similar words create similar maps of brain activity.

Video or audio stimuli, fMRI 60.000 voxel).

Gallant lab, Berkeley.

Possible form of Brain Fingerprints

fMRI: BFP is based on $V(X,t)$ voxel intensity of fMRI BOLD signal changes, contrasted between task and reference activity or resting state.

EEG: spatial, spatio-temporal, ERP maps/shapes, coherence, various phase synchronization indices.

1. **Spatial/Power:** direct localization/reconstruction of sources.
2. **EEG microstates,** sequences & transitions, dynamics in ROI space.
3. **Spatial/Synch:** changes in functional graph network structure.
4. **Frequency/Power:** ERS/ERD smoothed patterns $E(X,t,f)$.
5. **ERP global power maps:** spatio-temporal averaged energy distributions.
6. **EEG decomposition into components:** ICA, CCA, tensor, RP ...
7. Model-based: **The Virtual Brain**, integrating EEG/neuroimaging data.
8. Spectral fingerprinting (MEG, EEG), power distributions.

Neuroplastic changes of connectomes and functional connections as results of training for optimization of brain processes.

Conclusions

- Hierarchically modularized set of canonical networks is the best description of the brain. Connectomes form static localized networks, enabling dynamic, whole-brain states. We can use fMRI techniques to determine static structures that change slowly due to the neuroplasticity.
- Temporal state dynamics is based on rapid resynchronization of subnetworks on connectome scaffolding. Time scale of the order of 10 ms requires EEG/MEG or NiRS techniques. Activity of deeper brain structures is difficult to measure reliably. Invasive techniques have limited applicability in case of humans, but this may change if DARPA projects will be successful.
- Neurodynamics is the key to understanding of mental states, but it requires models of information processing that will help to interpret network states and their transitions. Influence of other RDoC levels on mental states may be understood indirectly, via changes in neurodynamics.
- Neuroimaging, M/EEG, etc. \Leftrightarrow models of whole brain (TVB) \Leftrightarrow networks, neurodynamics \Leftrightarrow interpretation, mental states: $S(B) \Leftrightarrow S(M)$.

Perspectives

- Many brain states are now linked to specific mental states, and can be transformed into signals that we can understand: motor intentions, plans, images, inner voices ...
- Some large-scale functional networks have reasonable (although still not perfect) interpretation, for example sensory networks, dorsal and ventral attention networks, executive control, motor networks.
- Individual differences and many psychological functions are directly linked to connectome and functional networks, including multistable properties.
- AI/ML draws inspirations from brain research, but also neural network models and learning algorithms (CNN, recurrence networks, reinforcement learning) help to interpret information processing in the brain.
- Many neurocognitive technologies are coming, helping to diagnose, repair and optimize brain processes.
